

2026 10th International Conference on RELIABILITY ENGINEERING

Hangzhou, China July 19-21, 2026

Special Session 17

Advanced Statistical Methods for Reliability Engineering Research and Practice

Goal >>>>

With the large-scale development of complex equipment, new energy systems and industrial infrastructure, challenges such as operational uncertainty, coupled multi-source failures and dynamic life degradation have become increasingly prominent. Traditional reliability analysis methods are insufficient to meet the requirements of high-precision performance evaluation. As an essential foundation of reliability research, advanced statistics can effectively quantify random interference, uncertainty propagation and degradation mechanisms, supporting equipment health assessment, remaining life prediction and systematic risk management. This special session focuses on cutting-edge statistical theories, including Bayesian statistics, stochastic processes, uncertainty quantification and multi-dimensional data analysis. It combines practical reliability scenarios in aerospace, nuclear power, renewable energy and intelligent manufacturing, exploring the optimization of statistical models, algorithm innovation and engineering application strategies. It aims to gather global researchers to share latest advances, promote the in-depth integration of advanced statistical tools and reliability engineering, and provide innovative theoretical and technical references for the safe operation and resilience enhancement of modern complex engineering systems.
